There were many theories regarding the PC port of GTA IV. There were those who speculated that the game would be on release day, while others speculated that it would take days, or even weeks to arrive. What we didn't anticipate was that Rockstar would release it within hours of the game's initial release. In fact, the only thing that could have taken more time was finding the computer that would play it. So what are the things you should know about the PC version? Here is a list of what it features: 4K support The game is fully compatible with Windows 8 and Windows 8.1 Support for hi-def resolutions of 2560 x 1600 Support for high-end graphic cards such as NVIDIA GTX 580 and AMD HD 6870 Improved support for non-Wine systems, including Mac OS X 10.6 and 10.7 Some games may not work with certain video cards, please see the full list of system requirements. Custom sliders for graphic settings, audio, and video Full keyboard and mouse support for easier navigation and aiming Gamepad support for Xbox 360 and Playstation 3 Supports 2 x 4k screens Supports both 2D and 3D headsets New installation system, no more need to enter the disk or a CD DVD-like interface makes it easy to find and install the game If you're a PC gamer, you've probably had some experience with first-person shooters. But how many of them do you remember? As you can see, PC versions tend to have some custom settings and problems that games are not able to reproduce on console. So what is the best way to play GTA IV? A first step is to ensure your system meets the requirements (see below). Other than that, the best experience is definitely to use a DirectX 11-capable video card. "No", you say, "DirectX 11 is a must if I want to play it on my PC?" Well, that's true. But you also have the option to download the most recent version of the game ("DirectX 10.1") which uses DirectX 11 and features some new graphic features. However, there is a way to get better performance if you're using DirectX 10: Use the game's 82157476af
